

Srujan Kumar

DevOps Engineer

"AWS · Kubernetes · Terraform · CI/CD · Docker"

srujanraj12k93@gmail.com — +91-9391037911 — GitHub - Sujju12 — LinkedIn

Professional Summary

Cloud Infrastructure Engineer with 3.6 years delivering production-grade AWS services for global logistics and enterprise-scale operations. Built and maintained Kubernetes-based microservice platforms with zero-downtime deployment pipelines using Jenkins, GitHub Actions, and Helm — cutting environment provisioning time by 65% through Terraform IaC. Hardened cloud security through RBAC scoping and IAM least-privilege policies across multi-account AWS environments, eliminating overprivileged access across core production workloads. Monitored cloud spend using AWS Cost Explorer and Budgets, delivering monthly usage/billing reports and driving continuous cost optimization by decommissioning idle resources and unused storage artifacts. Experienced operating in high-availability, compliance-sensitive infrastructure at enterprise scale.

Technical Skills

Cloud Platforms: AWS — EKS, EC2, S3, IAM, VPC, ALB, Lambda, CloudWatch, ECR, API Gateway, Route 53, RDS, SNS

Container Orchestration: Kubernetes, EKS, Helm, RBAC, Rolling Updates, Horizontal Pod Autoscaling (HPA), Namespace Isolation

CI/CD, GitOps & DevOps Tools: Jenkins, GitHub Actions, Maven, SonarQube, Docker, Docker Hub

Infrastructure as Code: Terraform (Modules, Remote State, DynamoDB Locking), Ansible

Observability: Prometheus, Grafana, CloudWatch (Dashboards, Alerts, Log Insights), OpenTelemetry

Security: IAM policy (Least privilege), SSL/TLS, Network policies

Scripting & Tools: Bash, Python, YAML, Git and Github, Linux (Ubuntu, Amazon Linux), ServiceNow, Jira

Professional Experience

DevOps Engineer

Oct 2021 – Aug 2024

Cognizant — Client: Wallenius Wilhelmsen (Enterprise Logistics)

- Engineered declarative Jenkins CI/CD pipelines integrating Maven, SonarQube, Docker multi-stage builds, ECR, and Kubernetes — eliminating manual release steps and enabling 100% automated delivery across environments.
- Orchestrated Gitflow branching strategy — enforcing PR approvals and merge policies, reducing integration conflicts by 60% and production rollbacks by 80%
- Deployed and maintained containerised microservice workloads across Dev, QA, and Production Kubernetes clusters — configuring namespace isolation, resource quotas, and health checks coordinating with the team during release cycles and maintaining deployment stability across environments and supporting consistent release cycles.
- Optimized Kubernetes rolling updates with maxSurge/maxUnavailable tuning — achieving zero-downtime deployments across production workloads
- Executed blue-green deployment workflows for production microservices — switching traffic between environments using Kubernetes service selectors and ALB target groups, enabling rollback within 2 minutes when required.
- Developed Helm charts with environment-specific values, integrated into Jenkins pipelines — ensuring reproducible deployments across dev, QA, and production.
- Enforced Kubernetes RBAC policies across EKS clusters — creating roles, role bindings, and service accounts with least-privilege access per team, achieving 100% RBAC compliance across all production workloads.
- Provisioned AWS infrastructure (VPC, EC2, IAM, ALB, S3) via Terraform modules — leveraging remote state with DynamoDB locking to cut provisioning time by 65%.

- Optimised Dockerfiles with layer caching and lightweight base images with automated image builds and ECR push integrated into Jenkins pipelines.
- Implemented observability stack (Prometheus, Grafana, CloudWatch) — reducing MTTR by 45% through proactive alerting on CPU, memory, and pod restarts.
- Governed AWS IAM policies with MFA enforcement and quarterly reviews — achieving 100% MFA compliance across production accounts.
- Automated SSL/TLS certificate lifecycle management — ensuring uninterrupted encrypted communication across Kubernetes microservices.
- Tracked and coordinated production incidents and release activities using ServiceNow and Jira—ensuring SLA adherence, supporting cross-team communication, ensuring timely incident resolution and maintaining clear post-incident documentation across the team.
- Diagnosed and remediated EKS container failures (OOMKilled, crash loop, and scheduling) — preventing recurrence through proactive monitoring and root cause analysis.
- Tracked and reported monthly AWS usage and billing trends via Cost Explorer, presenting cost-optimization findings to stakeholders and initiating approved tickets for idle resource decommissioning and storage cleanup.

Cloud Support Associate (Contract)

May 2020 – Nov 2020

Amazon

- Delivered SLA-driven support for AWS EC2, S3, and IAM incidents — escalating critical issues to engineering teams.
- Monitored distributed AWS environments — collaborating with support teams to resolve backend service outages and access issues.
- Gained hands-on expertise in EC2, S3, and IAM — forming a technical foundation for transition into DevOps engineering.

Career Development Period (Aug 2024 – Present)

Took a planned career break for family health responsibilities. Used this time to deepen technical expertise across Kubernetes, AWS, and DevOps automation through independent, production-style project work — including applying AI/LLM-based tooling to infrastructure operations, such as automated root-cause analysis, intelligent alerting, and AI-assisted troubleshooting agents — building sharper problem-solving habits and staying current with emerging AgentOps and AI-driven DevOps practices.

- Completed structured DevOps training covering Kubernetes, CI/CD pipelines, AWS, Terraform, and cloud security — validated through hands-on lab environments on KodeKloud and applied across independent project implementations.
- Practised Kubernetes networking and workload concepts through hands-on demo projects – configuring Ingress controllers (ALB and NGINX), API Gateway rate limiting and caching, StatefulSet and stateless workload management, and AWS developer services, including CodePipeline, CodeBuild, CodeCommit and CodeDeploy.
- Integrated AI tooling into DevOps workflows — built an AI-powered Kubernetes troubleshooting agent that automates detection and root cause analysis of cluster issues, including OOMKilled events, crash-loop restarts, and pod scheduling failures, reducing manual cluster debugging from hours to minutes.
- Built a cloud-native observability platform on Kubernetes implementing the three observability pillars — metrics collection and visualisation using Prometheus and Grafana, distributed tracing using OpenTelemetry and Jaeger, and centralised log aggregation using Loki — deployed with a full Jenkins and Helm CI/CD pipeline.
